TASK ASSIGNMENT

S.No	Task Name	Assign To	Date Completion
1.	User Scenario	Praveen S	02.10.2026
2.	Developer Account Creation	Praveen S	02.10.2026
3.	Verify Account	Praveen S	02.10.2026
4.	Object Creation – Support Ticket Intelligence	Praveen S	02.10.2026
5.	Object Field Creation (Issue Type, Description)	Sriram S	02.10.2026
6.	More Fields Creation (Priority Level, Status)	Sriram S	02.10.2026
7.	Object Tab Creation	Sriram S	02.10.2026
8.	Add Tab to the Sales App	Sriram S	02.10.2026
9.	Resolution Time and SLA Breach Risk Fields	Muralitharan S	02.10.2026
10.	Flow Creation (Get Account, Get Ticket)	Muralitharan S	02.10.2026
11.	Decision Element – Analyze Description	Muralitharan S	02.10.2026
12.	High Priority Path (Create Task, Set Agent)	Muralitharan S	02.10.2026
13.	Medium and Low Priority Paths	Vishwapriyan K	02.10.2026
14.	Flow Activation	Vishwapriyan K	02.10.2026
15.	Agentforce Agent Setup	Vishwapriyan K	02.10.2026
16.	Functional Testing and Screenshots	Vishwapriyan K	02.10.2026

1. Problem Statement

Customer support teams receive a large number of tickets every day. Most of the time, the priority of each ticket is decided manually by support staff, which is slow and depends on individual judgement. Urgent issues may be treated as normal ones and wait in the queue, while minor issues may take the time of experienced agents. Tickets are also assigned manually, which causes delays, uneven workload and a higher risk of missing the Service Level Agreement (SLA). There is a need for an intelligent system that can understand a ticket, predict its priority and assign it to the right person automatically.

2. Objective

- To design a custom Support Ticket Intelligence object in Salesforce to store ticket details.
- To predict the priority (High, Medium or Low) of a ticket by analysing its description.
- To automate ticket assignment and task creation for high priority tickets using Salesforce Flow.
- To reduce the SLA breach risk and the resolution time of tickets.
- To provide an Agentforce agent that answers questions about tickets in natural language.

3. Challenges

- Manual priority decisions are inconsistent and differ from one agent to another.
- Ticket descriptions are written in free text, so identifying urgency from them is difficult.
- High priority tickets get delayed when assignment is done manually.
- Uneven distribution of tickets leads to overloaded agents and missed SLAs.
- Configuring the flow logic, field relationships and agent actions correctly in Salesforce requires careful testing.

4. Solution Approach

The solution is built on the Salesforce platform using a custom object, an autolaunched Flow and an Agentforce agent.

- A custom object named Support Ticket Intelligence is created with fields such as Issue Type, Description, Priority Level, Status, Resolution Time (hrs) and SLA Breach Risk.
- An autolaunched flow, Support_Ticket_Intelligence, retrieves the Account and the Ticket records and stores their Ids in variables.
- A Decision element named Analyze Description checks the ticket description and sends the ticket to the High, Medium or Low priority path.
- On the High priority path, the flow creates a Task, sets the assigned agent and prepares the final message. Medium and Low paths set their respective final messages.

- The Coral Cloud Agent and Guest Agent in Agentforce Studio use the flow so that users can ask for ticket details and get the owner, priority, status, SLA breach risk and resolution time.

5. Milestone 1 – Salesforce Account

A Salesforce Developer Edition org (Coral Cloud Resort) was created and the Setup Home page was opened after login. This is the starting point for creating the object, the flow and the agent.

Figure 1: Salesforce Setup Home page after login

6. Milestone 2 – Objects Creation

A custom object named Support Ticket Intelligence was created to store the support tickets. It contains 14 fields, including Description, Issue Type, Priority Level, Resolution Time (hrs), SLA Breach Risk, Status and the auto-numbered Ticket Number.

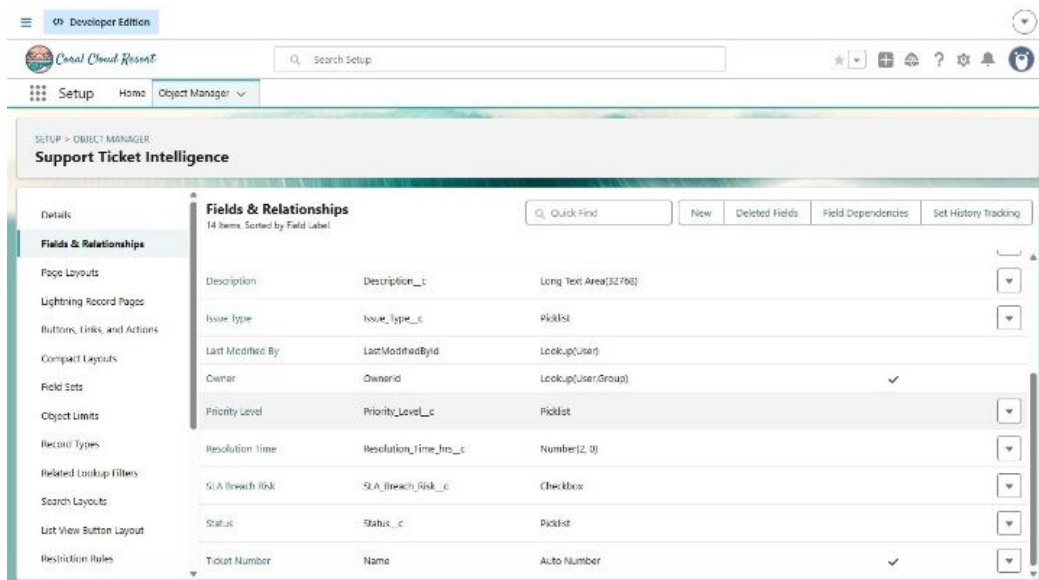

Figure 2: Fields and Relationships of Support Ticket Intelligence

7. Milestone 3 – Creating a Tab for Support Ticket Intelligence Object

A custom tab was created for the Support Ticket Intelligence object and added to the Sales app navigation, so that users can open the ticket records directly.

After the tab was created, the autolaunched flow Support_Ticket_Intelligence was built to analyse each ticket. It starts by getting the Account and the Ticket records and storing their Ids.

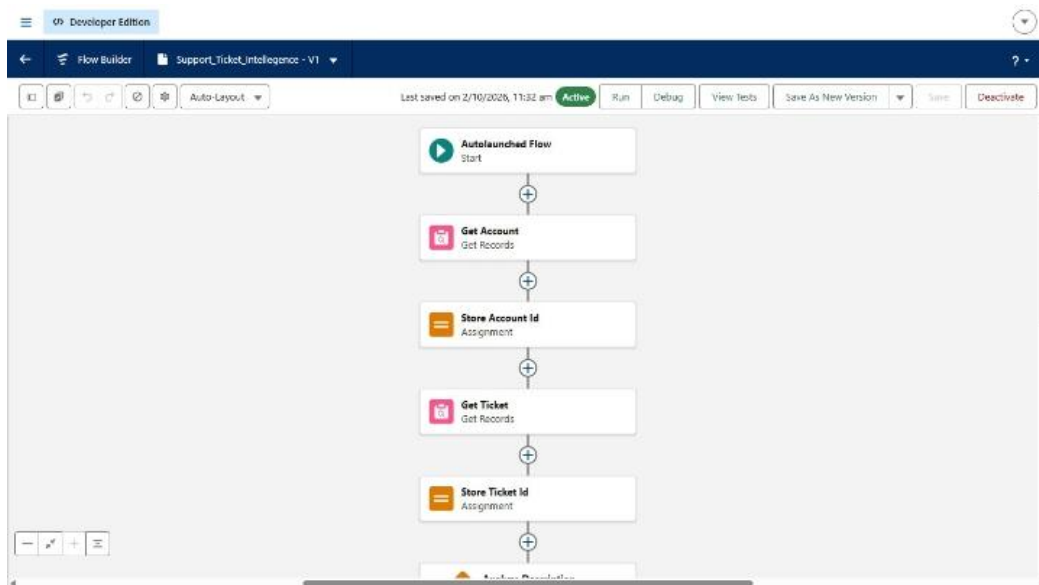

Figure 3: Start of the Support_Ticket_Intelligence flow

The Analyze Description decision element splits the flow into High, Medium and Low priority paths.

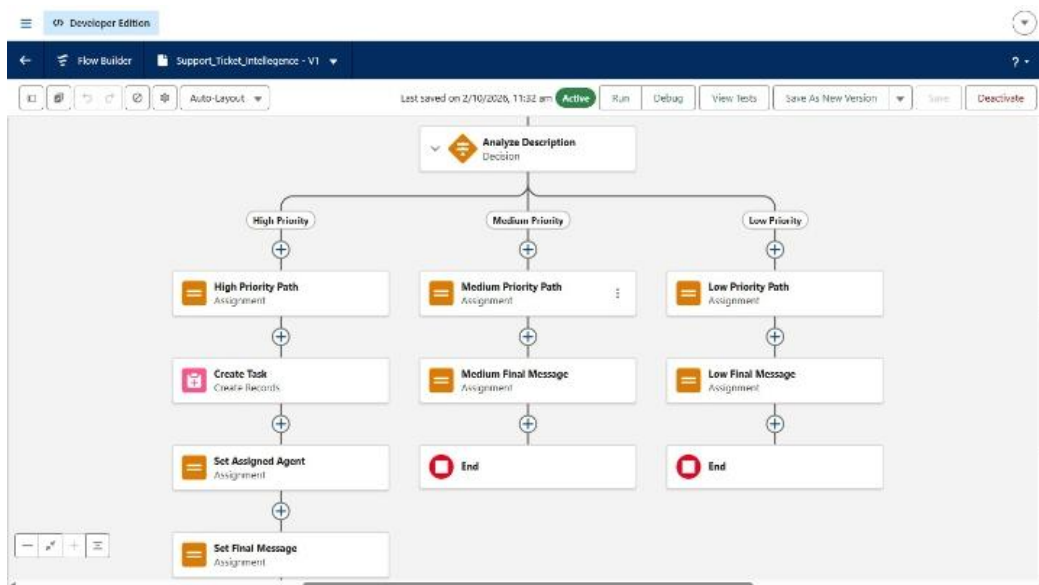

Figure 4: Decision element with High, Medium and Low priority paths

The High priority path creates a task, sets the assigned agent and the final message before ending. The Medium and Low paths set their final messages and end.

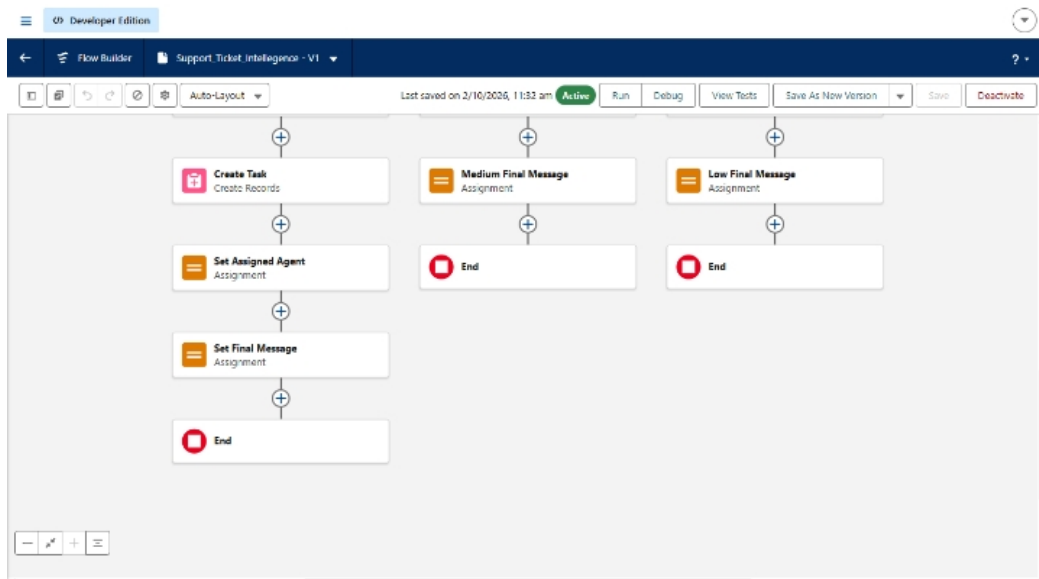

Figure 5: Task creation and assignment in the High priority path

The Agentforce Agents page lists the Coral Cloud Agent, Customer Service Agent, General Agent and Guest Agent, all active.

Agent Name	Type	Description	Created By	Active	Last Modified
Coral Cloud Agent	Employee	This is the Coral Cloud Agent, our Einstein Service ...	Pooled Org Ad...	✓	02 Oct 2026
Customer Service Agent	AgentforceEmpl...	The Customer Service Agent supports common ser...	Pooled Org Ad...	✓	12 Aug 2026
General Agent	AgentforceEmpl...	I automate common tasks and assist with experien...	Pooled Org Ad...	✓	12 Aug 2026
Guest Agent	AgentforceEmpl...	Handle to-dos and tasks related to guests reservati...	Pooled Org Ad...	✓	12 Aug 2026

Figure 6: Agentforce Agents list in Agentforce Studio

Finally, the Coral Cloud Agent, an Employee type Einstein Service Agent (Version 1, active), can be opened in the Agentforce Builder using the Open in Builder button.

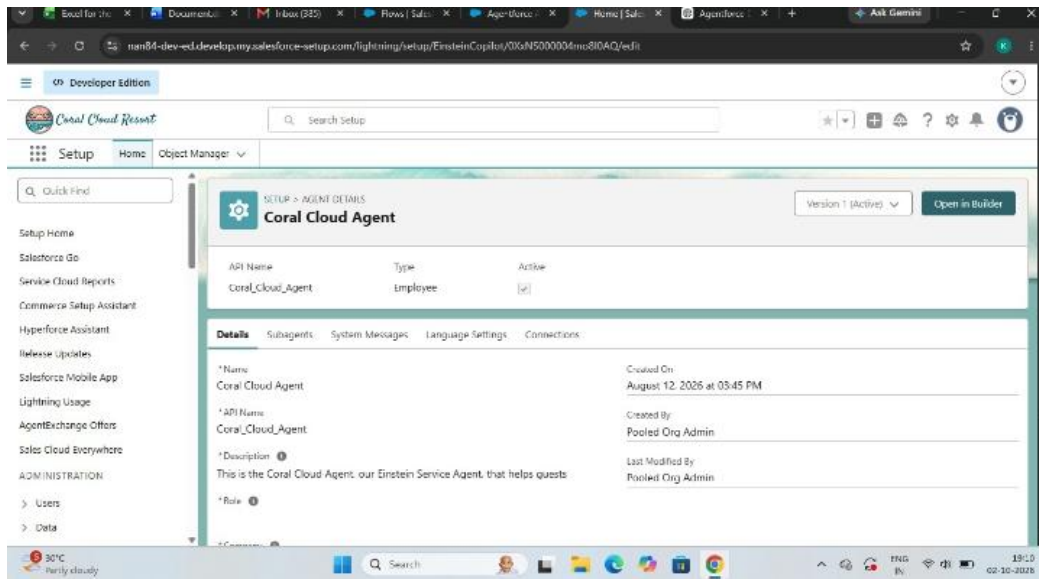

Figure 7: Coral Cloud Agent details with the Open in Builder option

Final outcome: the Support Ticket Intelligence tab shows the ticket TKT-0001 with its Customer, Contact, Issue Type, Priority Level and Status, and the Guest Agent returns the ticket details such as owner, priority, SLA breach risk and resolution time.

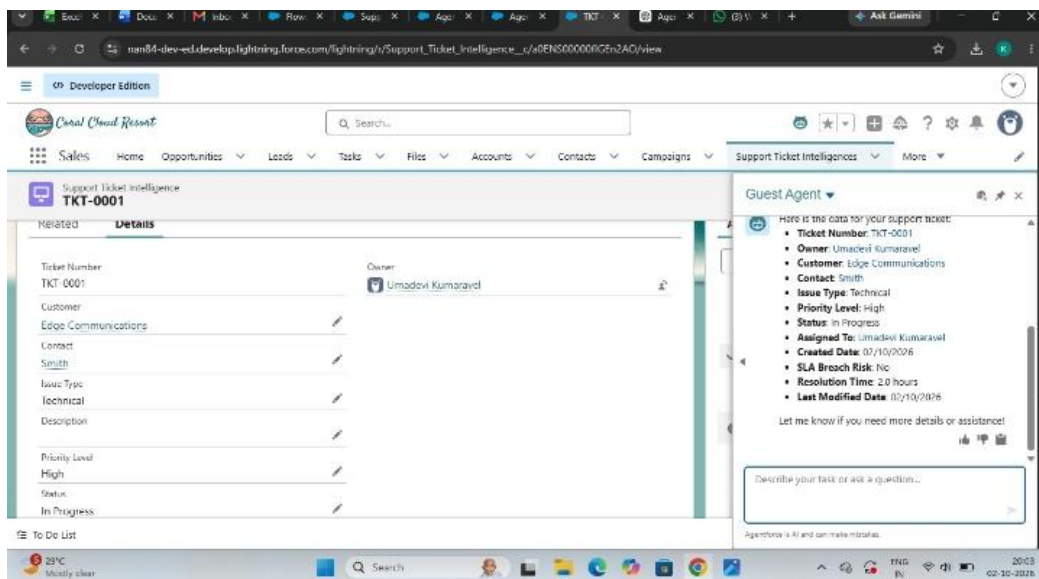

Figure 8: Final output – Support Ticket Intelligence tab and Guest Agent response for TKT-0001

8. Functional and Performance Testing

Functional testing was carried out to confirm that every part of the system works as expected. Performance was checked by observing how quickly the flow and the agent respond.

Test Case	Input / Action	Expected Result	Status
Ticket creation	Create a ticket with Issue Type, Description and Status	Record saved with auto number (TKT-0001)	Pass
Priority detection	Description analysed by the flow Decision element	Ticket routed to High, Medium or Low path	Pass

High priority handling	High priority ticket submitted	Task created and agent assigned automatically	Pass
Agent response	Ask the Agentforce agent for ticket details	Agent returns owner, priority, status, SLA risk and resolution time	Pass
SLA breach risk	Check SLA Breach Risk field	Checkbox shows correct value for the ticket	Pass

Performance observations: the flow runs immediately when a ticket is created, the agent responds to a query within a few seconds, and a ticket such as TKT-0001 with High priority shows a resolution time of 2.0 hours with no SLA breach risk.

9. Advantages and Disadvantages

Advantages

- Tickets are prioritised automatically, so urgent issues are handled first.
- Assignment is automatic, which saves time and balances the workload.
- Lower SLA breach risk and faster resolution time.
- Users can get ticket details in plain language through the Agentforce agent.
- Built with Salesforce clicks-not-code tools, so it is easy to maintain and extend.

Disadvantages

- The priority decision depends on the rules written in the flow, so it may miss unusual descriptions.
- Needs a Salesforce licence with Agentforce, which has a cost for large organisations.
- Agent responses can sometimes be wrong, so important details should be verified.
- Regular updates to the rules are needed as new types of issues appear.

10. Conclusion

The project shows how Salesforce Flow and Agentforce can be combined to make customer support faster and more reliable. Tickets are stored in a custom object, their priority is identified from the description, high priority tickets are assigned automatically with a task, and users can ask the agent for ticket details at any time. The system reduces manual work, improves response time and helps the support team meet its SLAs.

11. Future Scope

- Use machine learning or Einstein prediction models to predict priority more accurately instead of fixed rules.
- Assign tickets using agent skills, availability and current workload.
- Send automatic email, SMS or WhatsApp notifications to customers and agents.
- Build dashboards and reports for ticket trends, SLA performance and agent productivity.
- Support multiple languages and voice-based ticket creation.

- Integrate with other channels such as chat, social media and phone.

12. Appendix

A. Main Salesforce Components

Component	Purpose
Support_Ticket_Intelligence__c	Custom object that stores support ticket information.
Ticket Number (Name)	Auto number field that gives each ticket a unique number (TKT-0001).
Issue Type	Picklist field that stores the type of the issue (for example, Technical).
Description	Long text field that stores the ticket description analysed by the flow.
Priority Level	Picklist field that stores the priority (High, Medium or Low).
Status	Picklist field that stores the ticket status (for example, In Progress).
Resolution Time (hrs)	Number field that stores the time taken to resolve the ticket.
SLA Breach Risk	Checkbox field that shows whether the ticket may breach the SLA.
Support Ticket Intelligence Tab	Custom tab that gives direct access to ticket records.
Support_Ticket_Intelligence Flow	Autolaunched flow that analyses the ticket and decides the priority path.
Analyze Description (Decision)	Splits the flow into High, Medium and Low priority paths.
Create Task	Creates a task for High priority tickets.
Coral Cloud Agent	Einstein Service Agent that helps users with ticket queries.
Guest Agent	Agentforce agent that returns ticket details to users.

B. Team Implementation Checklist

Milestone	Completion Check
Milestone 1	Salesforce Developer Edition account created and login verified.
Milestone 2	Support Ticket Intelligence object and its fields created.
Milestone 3	Tab created and added to the app; flow and agent configured.
Final	Functional testing done and evidence/screenshots collected.
